Integrated capacitive touchscreens refer to touchscreens that incorporate capacitive touch sensing technology directly into the display panel or module. Capacitive touch

technology utilizes the electrical properties of the human body to detect touch and input gestures.

In integrated capacitive touchscreens, the touch-sensitive layer is typically made up of a transparent conductive material, such as indium tin oxide (ITO), which is coated on the surface of the display or sandwiched between layers of the display module. This conductive layer forms a grid or matrix of electrodes that can detect changes in capacitance when a user's finger or a capacitive stylus comes into contact with the screen.
