## Abstracts

The global Integrated Computing and Control Solution market size is expected to reach \$ 3134 million by 2032, rising at a market growth of 16.7% CAGR during the forecast period (2026-2032).

The integrated computing and control solution is a technical architecture that tightly integrates communication, perception, computing and control functions into the same system, and realizes the automation, intelligence and optimized management of complex systems through real-time data collection, analysis and control. This solution is widely used in smart manufacturing, smart cities, autonomous driving and other fields, aiming to improve the system's response speed, accuracy and overall efficiency, and support the digital transformation and intelligent upgrading of various industries.

The integrated sensing, computing, and control solution industry chain can be summarized into three major layers: the sensing layer, the computing and control layer, and the application and service layer. The upstream layer, the sensing layer, mainly includes various sensors (temperature, pressure, location, environment, etc.), data acquisition equipment, edge nodes, and IoT communication modules. Its gross profit margin is relatively low, generally between 20% and 40%, affected by hardware costs and mass production scale. The midstream layer, the computing and control core layer, encompasses edge computing units, real-time control systems, algorithm platforms, data processing engines, and industrial AI models. Its gross profit margin is higher, approximately 50% to 70%, and it is the value-concentrating link in the industry chain, responsible for real-time processing of sensing data, decision generation, and control command issuance. The downstream layer, the industry application and comprehensive solution layer, includes applications in smart manufacturing, smart cities, energy management, transportation, building automation, and other scenarios, as well as system integration, customized deployment, and operation and maintenance services. Its gross profit margin is affected by project scale and the degree of customization,

generally between 35% and 55%. Overall, the industry chain profits are mainly concentrated in the midstream computing and control core platform and high-end system integration services.

The integrated solution of synergy computing and control is a key technology to promote the development of intelligent systems. It realizes the comprehensive optimization and automated management of complex systems by integrating communication, perception, computing and control capabilities. This integrated solution not only improves the response speed and accuracy of the system, but also enhances the flexibility and adaptability of various industries, becoming an important driving force for digital transformation in the fields of intelligent manufacturing and smart cities. In the future, with the continuous advancement of technology, the integration of synergy computing and control will further lead the intelligent transformation of various industries and bring a more efficient and sustainable development model.
