## Abstracts

The global Integrated Facility Systems market size is expected to reach \$ 23426 million by 2032, rising at a market growth of 5.7% CAGR during the forecast period (2026-2032).

To address the problems of isolated operation of subsystems, high energy consumption, and inefficient operation and maintenance response in traditional facility management, integrated facility management systems have emerged. Since their inception in the 1980s with the integration of building automation technology and computer networks, the field of intelligent management of buildings and industrial facilities has entered a new stage of integration and intelligence. Currently, integrated facility management systems have developed into intelligent control platforms integrating multiple modules such as HVAC, lighting control, energy monitoring, security and fire protection, and equipment operation and maintenance. They are widely used in commercial buildings, industrial parks, hospitals, schools, transportation hubs, and data centers. Through data linkage analysis and centralized intelligent control, they significantly improve facility operating efficiency, reduce life-cycle energy consumption, and optimize personnel and space management experiences, serving as a professional and intelligent management hub.

Integrated facility systems are shifting from 'single-function integration' to 'full-scenario intelligent collaboration,' reshaping the operating paradigm of cities, industries, and public facilities through technological iteration, ecosystem building, and policy coordination. Their value lies not only in improving facility efficiency and reducing operating and maintenance costs, but also in promoting the upgrading of social governance towards a more refined, humanized, and sustainable direction, ultimately building a new future facility ecosystem of 'virtual and real coexistence, benefiting

everyone,' providing core support for global new infrastructure construction and sustainable development.
