Abstracts

Integrated Graphics Processing Unit or integrated graphics processors (IGP) utilize a portion of a computer's system RAM rather than dedicated graphics memory. IGPs can be integrated onto the motherboard as part of the chipset, or on the same die with the CPU (like AMD APU or Intel HD Graphics). On certain motherboards AMD's IGPs can use dedicated sideport memory. This is a separate fixed block of high performance memory that is dedicated for use by the GPU.

Scope of the Report:

This report focuses on the Integrated Graphics Processing Unit in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application.

The main benefit that integrated graphics deliver is affordability as laptops with discrete graphics can cost hundreds more. The combined workload also means less heat output and less power usage, which can translate to longer battery life. To enhance battery life, most laptops with discrete graphics on board switch to their integrated chips when not performing demanding tasks.

The worldwide market for Integrated Graphics Processing Unit is expected to grow at a CAGR of roughly xx% over the next five years, will reach xx million US\$ in 2023, from xx million US\$ in 2017, according to a new GIR (Global Info Research) study.
