Abstracts

According to our (Global Info Research) latest study, the global Integrated Pest Management Solution market size was valued at US\$ 2768 million in 2025 and is forecast to a readjusted size of US\$ 4357 million by 2032 with a CAGR of 6.6% during review period.

Integrated pest management (IPM) is a comprehensive and sustainable pest management strategy that combines multiple methods and technologies, including biological, physical, cultural, and chemical control, to control pest populations and damage, minimizing environmental, economic, and health impacts. This integrated approach aims to maintain ecological balance, reduce pesticide use, lower agricultural production costs, and improve the quality and safety of agricultural products.

The IPM industry chain primarily consists of upstream raw material and technology suppliers, midstream solution providers, and downstream application industries. Upstream mainly includes suppliers of products and technologies such as biopesticides, chemical pesticides, traps, pheromones, monitoring equipment, smart sensors, drones, and digital agriculture platforms. Midstream comprises IPM service providers and solution platform companies, responsible for pest monitoring, data analysis, early warning system construction, and implementation of control programs, integrating chemical, biological, and physical control technologies. Downstream applications are widespread, including agricultural planting, grain storage, food processing, public health, urban landscaping, and commercial buildings. Overall, due to the strong service attributes and high added value of technology in this industry, the gross profit margin of midstream solution providers is usually between 30% and 55%. Among them, the gross profit margin of digital monitoring platforms and biological control technology services is

relatively higher, while the gross profit margin of traditional drug sales and basic prevention and control services is generally around 20% to 35%.

Integrated pest management solutions are one of the keys to sustainable development of modern agriculture. Their importance lies not only in effectively controlling pests, but also in minimizing damage to the environment and ecosystem while protecting crops. By comprehensively using biological, chemical, physical and cultural means, this management method not only effectively reduces the risk of pesticide residues and environmental pollution, but also promotes the maintenance of ecological balance and the realization of agricultural sustainability. Therefore, integrated pest management is regarded as an important direction for future agricultural development, providing a feasible and sustainable solution for agricultural production and food safety.
