Abstracts

The global Integrated Robotic Bending System market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Integrated robotic bending systems offer automation combined with sheet metal deformation, which can overcome the idea that robotic solutions require high throughput to be truly efficient. The integrated system is modular and can be built from a panel bending machine or bending machine and an industrial robot. Since all programming is done in the office, the operator's activities are easy and he can limit himself to the shop to check the programming and concentrate on loading and unloading operations. Thanks to offline programming, the level of digitalization of the bending phase is increased and aligned with other sheet metal processing technologies, allowing it to be increasingly integrated into company production systems and follow the evolution of processes tracked by Industry 4.0.

This report studies the global Integrated Robotic Bending System production, demand, key manufacturers, and key regions.
