Abstracts

According to our (Global Info Research) latest study, the global Integrated Ultrasonic Level Meter market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

The ultrasonic level meter is installed on the top of the container. Under the control of the electronic unit, the probe emits a beam of ultrasonic pulses to the object to be measured. The sound wave is reflected by the surface of the object, and part of the reflected echo is received by the probe and converted into an electrical signal. The time from the ultrasonic emission to the re-reception is proportional to the distance from the probe to the object to be measured. The electronic unit detects this time and calculates the measured distance based on the known speed of sound. The level value can be obtained by subtraction.
