The global Intelligent Anti-Glare Headlight System Controller market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The intelligent anti-glare headlight system controller is a device used to control the headlights of the car. It can realize the automatic adjustment of the headlights to adapt to different driving environments and road conditions, and improve the safety and comfort of the car. The structure of the intelligent anti-glare headlight system controller generally consists of a controller body and one or more sensors. Its working principle is to judge the current driving situation by receiving signals from the sensors, such as vehicle speed, light, and vehicle distance. The state and the position of the other vehicle, and then send corresponding control commands to the headlights through the controller body to adjust the brightness, angle, mode, etc. of the headlights. The intelligent anti-glare headlight system controller has many functions, such as: automatic high and low beam switching: the intelligent anti-glare headlight system controller can automatically switch the high beam or low beam according to the distance and direction of the other vehicle to avoid The opponent's vehicle causes glare, while ensuring its own lighting effect. Adaptive turn signal: The intelligent anti-glare headlight system controller can automatically adjust the angle of the headlight according to the signal of the turn signal and the steering angle, so as to increase the field of vision and safety when turning. Matrix headlights: The intelligent anti-glare headlight system controller can automatically adjust the brightness and direction of each LED bulb in the headlight according to the road conditions and the position of the other vehicle to form an irregular beam shape to maximize Maximize the range and effect of lighting while avoiding glare to other vehicles.
