## Abstracts

The global Intelligent Breeding Platform market size is expected to reach \$ 3085 million by 2032, rising at a market growth of 14.5% CAGR during the forecast period (2026-2032).

The intelligent breeding platform is a fully digital breeding decision-making system integrating biotechnology, information technology, and artificial intelligence, serving as a core infrastructure for the Breeding 4.0 era. Driven by big data and AI algorithms, it integrates multi-dimensional data such as genotype, phenotype, and environment to achieve intelligent, efficient, and precise management of germplasm, experimental design, data analysis, trait prediction, parent selection, and variety breeding.

The intelligent breeding platform is an integrated, cloud-based, and visualized digital platform built upon cloud computing, big data, artificial intelligence, bioinformatics, and high-throughput omics technologies (genomics/phenomena/metabolomics). Its core function is to integrate breeding data across the entire industry chain, automate analysis, and provide intelligent prediction and decision-making, transforming traditional 'experience-based breeding' into 'data-driven precision intelligent breeding,' significantly shortening cycles, improving efficiency, reducing costs, and increasing accuracy.

The core functions of the intelligent breeding platform include germplasm resource management, breeding experiment management, genotype big data analysis, phenotypic data management and analysis, intelligent prediction and decision-making, and breeding simulation.
