According to our (Global Info Research) latest study, the global Intelligent Industrial Basic Servo Systems market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

The intelligent industrial basic servo system consists of three parts: servo drive, servo motor and encoder. The servo drive is responsible for decomposing the information received from the controller into commands that can be executed by a single degree of freedom system, and then transmitting it to the actuator (servo motor); the servo motor converts the received current signal into torque and speed to drive the control object, to realize the control of the angle, angular velocity and joint torque of each joint; as the feedback device of the servo system, the encoder largely determines the accuracy of the servo system. The encoder is installed on the servo motor and rotates synchronously with the motor. The encoder also rotates once the motor rotates. While rotating, the encoder sends the encoded signal back to the controller, and the controller judges the steering, speed, and position information of the servo motor.
