According to our (Global Info Research) latest study, the global Intelligent Remote Terminal Unit market size was valued at USD 2430.1 million in 2023 and is forecast to a readjusted size of USD 3542.4 million by 2030 with a CAGR of 5.5% during review period.

A remote terminal unit (RTU) is a microprocessor-controlled electronic device that interfaces objects in the physical world to a distributed control system or SCADA (supervisory control and data acquisition) system by transmitting telemetry data to a master system, and by using messages from the master supervisory system to control connected objects.

With the evolution of the era of big data, Internet of Things (IoT) technology is being widely used and its architecture contains cloud computing and intelligent terminals. In the past, workers needed to regularly supervise larger oilfield zones. The use of intelligent terminal unit can effectively identify status of equipment, and greatly reduce costs of man power. Intelligent terminal unit can collect real-time information of production, to provide the basis for the deployment of resources. For example for Oil and Gas industry, normally transmission and distribution pipelines are located a long way from civilization, their maintenance is more difficult. Therefore, when pipelines leak, the intelligent terminal can monitor the status of the pipes, instantly provide feedback to the monitoring center, and collect all the pipeline information.
