Abstracts

According to our (Global Info Research) latest study, the global Intelligent Vehicle Infrastructure Cooperative Systems (IVICS) market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

The Cooperative Vehicle Infrastructure System (CVIS) is an advanced transportation system that aims to improve road safety, traffic efficiency, and overall transportation effectiveness by enabling communication and cooperation between vehicles (V2V - Vehicle-to-Vehicle) and between vehicles and infrastructure (V2I - Vehicle-to-Infrastructure).

CVIS relies on advanced communication technologies, such as Dedicated Short-Range Communication (DSRC) or Cellular Vehicle-to-Everything (C-V2X), to facilitate real-time exchange of data and information among vehicles and between vehicles and surrounding infrastructure, such as traffic signals, road signs, and traffic management centers.

The vehicle-road collaboration industry involves a wide range of areas, a long industrial chain, and prominent cross-border integration features, covering all aspects of chips, modules, terminals, platforms, testing and verification, network security, and system integration. Therefore, the development of vehicle-road coordination depends to a certain extent on the development of various technologies. At the same time, the development of this industry will also reversely promote the technological iteration and development innovation of some related industries.

The industry logic of vehicle-road coordination is basically the same as that of the communication network. Only a sound infrastructure can bring about the popularization of industrial terminals and the promotion of operations and applications. Therefore, the maturity of the vehicle-road coordination industry requires a relatively long process. The implementation and operation of the vehicle-road coordination system can only be achieved when the basic infrastructure of each part is basically completed.
