## Abstracts

The global Intelligent Video (IV) market size is expected to reach \$ 17320 million by 2032, rising at a market growth of 11.1% CAGR during the forecast period (2026-2032).

Intelligent Video (IV) is a technology integrating computer vision and artificial intelligence, which enables computers to automatically identify, track, and analyze key targets or abnormal events in video streams. By filtering irrelevant information and establishing mappings between video images and event descriptions, it transforms traditional passive monitoring into active perception and early warning, significantly reducing reliance on manual monitoring and improving the efficiency and accuracy of video data utilization across various scenarios.

Demand for IV is growing rapidly driven by the acceleration of digital transformation in industries such as public security, smart cities, and manufacturing, as well as the need for refined management and risk control. Businesses and governments are eager to use it to solve pain points like low manual monitoring efficiency and high error rates. Key opportunities lie in developing industry-specific solutions (e.g., intelligent inspection for manufacturing, traffic flow management for transportation), promoting the integration of edge computing and multi-modal AI to enhance real-time processing capabilities, and expanding into emerging scenarios such as digital twins and virtual interactions. Additionally, providing cost-effective lightweight solutions for small and medium-sized enterprises and complying with data security regulations to build user trust can further tap into market potential.
