Interactive electronic whiteboard is a human-computer interaction device for education or conferences, which can realize dust-free writing, freehand writing, remote conference and other functions. In the past two years, interactive electronic whiteboards have shown extremely high growth not only in education but also in the commercial market. Interactive electronic whiteboards are used in e-commerce, large-scale exhibitions and activities.

Driven by the informationization policy, interactive electronic whiteboards have been widely used in the fields of education and business, and the product penetration rate in the field of education is relatively high. Educational informatization has two meanings. One is teaching informatization, that is, using information technology as teaching content to cultivate modern talents with information literacy; the other is information-based teaching, that is, using information equipment as a teaching tool to improve the quality and efficiency of teaching.

Educational informatization has had a revolutionary impact on educational development since the 1990s and has gradually become a global trend. Whether it is developed

countries such as the United States, the United Kingdom, and Japan, or emerging market countries such as Turkey, Russia, and India, they have proposed their own educational informatization development strategies. Interactive electronic whiteboards are an educational or conference-assisted human-computer interaction device that realizes dust-free writing, casual writing, remote meetings and other functions.

In the wave of digital transformation, interactive electronic whiteboards are evolving from a single teaching tool to a revolutionary carrier that reshapes the way humans collaborate. As a comprehensive platform that integrates touch technology, cloud computing and intelligent algorithms, it not only realizes the digital transition of writing media, but also reconstructs the space-time boundaries of knowledge transfer and business decision-making through real-time interaction. Data from the education sector shows that more than 68% of K12 classrooms around the world are equipped with smart whiteboard systems, teachers' lesson preparation efficiency has increased by 40%, and students' classroom participation has increased by 55%. This change is subverting the 'chalk + blackboard' teaching model that has lasted for hundreds of years. When teachers can instantly call up three-dimensional molecular models to demonstrate chemical reactions, and when historical events are presented in a dynamic timeline, knowledge acquisition has broken through the limitations of the two-dimensional plane and turned to immersive, multi-dimensional cognitive construction. The explosive growth of commercial application scenarios further highlights its strategic value. Hybrid conference rooms equipped with smart whiteboards have achieved a significant improvement in efficiency. The commercial market has become the most promising market for interactive electronic whiteboard groups.
