According to our (Global Info Research) latest study, the global Interdigitated Electrodes (IDE) market size was valued at US\$ 109 million in 2024 and is forecast to a readjusted size of USD 157 million by 2031 with a CAGR of 5.4% during review period.

Interdigitated Electrodes (IDE) are a type of electrode configuration commonly used in sensors and other electronic devices for measuring and detecting various physical properties such as pressure, temperature, or concentration of substances. In this design, two sets of electrodes are arranged in a comb-like pattern, where the fingers of one electrode interlace with those of the other. This configuration increases the surface area in contact with the sample, enhancing sensitivity and enabling more precise measurements. IDEs are widely used in applications such as capacitive sensors, electrochemical sensors, and microfluidic devices, due to their ability to generate highly sensitive responses with minimal noise, making them ideal for applications in biosensing, environmental monitoring, and industrial measurements.
