## Abstracts

According to our (Global Info Research) latest study, the global Interferometric Profiler market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Interferometric Profilometer (Interferometric Profilometer) is a high-precision measuring device that uses interferometric technology to measure the contour and shape of the surface of an object. The working principle of the interferometric profiler is to use the wave characteristics of light and the phenomenon of interference. When the reference beam interferes with the beam reflected from the surface of the measured object, an interference pattern or fringe is formed. By analyzing the characteristics of the interference pattern or interference fringe, information such as the height, contour and shape of the surface of the measured object can be deduced. With the advantages of high precision, non-contact and fast measurement, the interferometric profiler is suitable for many application fields, such as precision manufacturing, optical components, surface quality inspection, microstructure analysis, etc. It can measure different types of objects such as flat surfaces, curved surfaces, and transparent objects, and provide accurate surface topography data, which is helpful for quality control and product design optimization.
