Global Interferometric Synthetic Aperture Radar (InSAR) key players include TRE ALTAMiRA (CLS Group), GroundProbe (Orica), MDA, etc. Global top three manufacturers hold a share over 75%.

Europe is the largest market, with a share about 40%, followed by Asia-Pacific, and North America, both have a share about 50 percent.

In terms of product, Monitoring is the largest segment, with a share over 50%. And in terms of application, the largest application is Oil & Gas Extraction, followed by Mining, Geohazards & Environment, Underground Engineering, etc.

Interferometric synthetic aperture radar, abbreviated InSAR, is a radar technique used in geodesy and remote sensing. This geodetic method uses two or more synthetic aperture radar (SAR) images to generate maps of surface deformation or digital elevation, using differences in the phase of the waves returning to the satellite or aircraft. The technique can potentially measure millimetre-scale changes in deformation over spans of days to years. It has applications for geophysical monitoring of natural hazards, for example earthquakes, volcanoes and landslides, and in structural engineering, in particular monitoring of subsidence and structural stability.
