## Abstracts

The intermittent cartoning machine is a kind of equipment that during the automatic cartoning process, after each carton is completed, it will stop working, wait for the arrival of the next product, and then start the next work. The working characteristic of this cartoning machine is the reciprocating motion of a single head of the transmission chain, with one stop and one movement forming a cartoning cycle. Its production speed is relatively slow, generally 50 to 100 boxes/minute. It is difficult to break through the speed limit of 100 boxes/minute, because after exceeding this speed, the stability of the equipment will become very poor and it will not be able to meet the production needs of the market. .

According to our (Global Info Research) latest study, the global Intermittent Cartoning Machine market size was valued at US\$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of %during review period.
