According to our (Global Info Research) latest study, the global Intermittent DVT Pump market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

An intermittent DVT pump is a medical device used to prevent the occurrence of DVT. It works by periodically giving intermittent pressure to the patient's lower limbs to promote blood circulation and reduce the risk of congestion and thrombosis.

Intermittent DVT pumps typically consist of one or more cuffs, a compressed air pump, and a controller. When the pump is activated, the compressed air pump delivers air into the cuff, applying pressure to the patient's limbs. This periodic pressure change can simulate the pressure exerted by muscles on blood vessels during walking, helping blood flow back and reducing the risk of DVT. When used, it needs to be adjusted and monitored according to the patient's specific situation and the doctor's recommendations, and should be operated by medical professionals.
