Abstracts

The global Intermittent DVT Pump market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Intermittent DVT pumps typically consist of one or more cuffs, a compressed air pump, and a controller. When the pump is activated, the compressed air pump delivers air into the cuff, applying pressure to the patient's limbs. This periodic pressure change can simulate the pressure exerted by muscles on blood vessels during walking, helping blood flow back and reducing the risk of DVT. When used, it needs to be adjusted and monitored according to the patient's specific situation and the doctor's recommendations, and should be operated by medical professionals.

An intermittent DVT pump is a medical device used to prevent the occurrence of DVT. It works by periodically giving intermittent pressure to the patient's lower limbs to promote blood circulation and reduce the risk of congestion and thrombosis.

This report studies the global Intermittent DVT Pump production, demand, key manufacturers, and key regions.
