## Abstracts

According to our (Global Info Research) latest study, the global Intermittent Pneumatic Compression (IPC) Device market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

An intermittent pneumatic compression device is a device used to deliver intermittent external pressure therapy to patients. This device is usually used to prevent deep vein thrombosis or treat symptoms such as limb edema. Its working principle is to promote blood circulation, reduce venous pressure, and reduce congestion and edema through the application of appropriate periodic pressure.

Intermittent pneumatic compression devices consist of one or more cuffs that apply pressure to a patient's limbs in turns. When the device is activated, a compressed air pump creates air pressure that sends air into the cuff, inflating the cuff and applying pressure to the patient's limbs. After pressure is applied for a period of time, the air sleeve releases the pressure and expels the air in preparation for the next application of pressure. Intermittent pneumatic compression devices are typically operated by medical professionals and adjusted and monitored based on the patient's specific condition and needs.
