Abstracts

According to our (Global Info Research) latest study, the global Internal Bonded Post-Tensioning Systems market size was valued at US\$ 275 million in 2025 and is forecast to a readjusted size of US\$ 389 million by 2032 with a CAGR of 5.1% during review period.

Internal bonded post-tensioning systems involve the use of steel tendons placed within ducts embedded in the concrete. After the concrete cures, the tendons are tensioned using hydraulic jacks. The tendons are then bonded to the concrete through the use of grout, which fills the ducts and secures the tendons in place. This bonding creates a continuous, integrated system where the tendons and concrete work together to resist loads. Internal bonded post-tensioning is commonly used in building floors, bridges, and other structures where high strength and durability are required, helping to minimize cracking, reduce deflections, and increase load-bearing capacity.

Market demand for bonded post-tensioning systems remains consistently robust, driven by a confluence of factors: the ever-increasing requirements in modern construction for structural span, crack resistance, and durability; the shift in infrastructure development toward higher quality and longer service life; the widespread recognition of the technical advantages of bonded systems regarding fire safety, overall stiffness, and long-term deformation control; the significant enhancement of duct compaction and corrosion protection reliability through the use of high-performance grouting materials and vacuum-assisted processes; and the explicit support for high-seismic-performance prestressed concrete structures found in design codes across various nations. Meanwhile, in key engineering fields such as nuclear power, water conservancy, and rail transportation, its excellent collaborative performance and structural integrity assurance capabilities make

it an irreplaceable core technology solution.
