Internal combustion power generation equipment is a device that uses an internal combustion engine to drive a generator to convert the chemical energy of fuel into electrical energy. It drives the engine to generate mechanical energy by burning diesel, natural gas, gasoline or other fuels, and then converts the mechanical energy into electrical energy through the generator. Internal combustion power generation equipment is widely used in emergency backup power supply, industrial and commercial power supply, power supply in remote areas, outdoor activities, emergency rescue and other fields, providing reliable and flexible power solutions. Its high efficiency, durability and portability make it a key equipment for power supply in various scenarios.

Internal combustion power generation equipment plays an indispensable role in modern society, especially in emergency backup power supply and power supply in remote areas. Although internal combustion power generation equipment faces environmental pollution and carbon emissions due to the combustion of fossil fuels, its high efficiency, reliability and portability still make it irreplaceable in many key scenarios. With the

advancement of technology and the development of fuel alternatives, internal combustion power generation equipment is expected to further reduce environmental impact and achieve more sustainable development while maintaining its advantages in the future.
