## Abstracts

The global Internal Cycloidal Gear Pump market size is expected to reach \$ 793 million by 2032, rising at a market growth of 3.6% CAGR during the forecast period (2026-2032).

The internal-meshing cycloidal gear pump (also known as a cycloidal rotor pump or Gerotor pump) is a positive-displacement pump that conveys fluid by utilizing the eccentric meshing of internal and external rotors to create varying sealed volumes. Comprising a drive gear and a driven gear, it is characterized by its compact structure, high rotational speed, low noise levels, minimal pulsation, and strong self-priming capabilities.

The upstream segment of the industry is primarily dominated by high-strength powder metallurgy materials, alloy steels, and high-precision machining equipment. Notably, the machining precision of the cycloidal tooth profiles on the internal and external rotors directly determines the pump's volumetric efficiency and noise levels; consequently, high-precision CNC grinding machines and powder metallurgy sintering processes constitute the core technological barriers. The midstream segment focuses on the R&D and assembly of the pump body, where the key competitive factors lie in tooth profile compensation design and the reliability of the sealing structure. By 2025, global sales volume is projected to reach the million-unit level, with market prices typically ranging between \$300 and \$1,400 per unit. The industry's gross profit margin falls within the range of 15% to 25%.
