The Internal Stud Framing System is a structural framework used in building construction, primarily for interior walls and partitions. It typically consists of vertical studs (usually made of wood, metal, or engineered materials) spaced at regular intervals and connected by horizontal top and bottom plates. This system provides a stable base for attaching finishes like drywall, paneling, or plaster, while also accommodating electrical wiring, plumbing, and insulation within the cavity formed by the studs. Known for its flexibility, cost-effectiveness, and ease of installation, it allows for efficient customization of room layouts and is widely used in residential, commercial, and industrial projects. The studs act as load-bearing elements in some cases or as non-load-bearing partitions to divide spaces, depending on the building design.
