## Abstracts

An internally fused capacitor is a specially designed capacitor with an integrated fuse as an additional overcurrent protection device. Generally, capacitors may be affected by overload current during operation. Without appropriate protection measures, overload may cause capacitor damage or failure. To prevent this from happening, internally fused capacitors are designed with a fuse inside them that breaks the circuit in the event of an overcurrent, preventing the capacitor from being damaged. This design can enhance the safety and reliability of the capacitor, protect the capacitor from damage by overload current, and extend its service life. Internally fused capacitors are commonly used in a variety of circuits, especially in applications where additional protection of the capacitor is required.

According to our (Global Info Research) latest study, the global Internally Fused Capacitor market size was valued at US\$ 193 million in 2023 and is forecast to a readjusted size of USD 314 million by 2030 with a CAGR of 7.1% during review period.

As a subdivision of the capacitor industry, the internally fused capacitor market has shown steady growth in recent years. With the rapid development of the electronics industry, the demand for capacitors is increasing, especially in some fields that require high circuit safety and stability, such as communications, industrial control, power electronics, etc. Capacitors with internal fuses are unique due to their unique It is popular for its overload protection function. Therefore, the capacitor market with internal fuses has broad development prospects and huge market potential.
