Abstracts

The global Interphase Spacer market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The main concept behind the application of interphase spacers is to prevent the most dangerous consequence from conductor galloping, namely phase-to-phase short-circuits. Attaining this is relatively straightforward and involves providing in-span mechanical couplings between phases, thereby maintaining phase-to-phase clearances at some pre-determined, acceptable limit. Moreover, from the oscillation damping point of view, these devices provide further benefit by limiting any torsional (twisting) motion of conductors or conductor bundles. Interphase spacers are applied to maintain constant distance between phases of an overhead line. The most frequent situations where these find application are where a line is exposed to strong winds and snowstorms that can generate ice sleeves on conductors.

This report studies the global Interphase Spacer production, demand, key manufacturers, and key regions.

This report is a detailed and comprehensive analysis of the world market for Interphase Spacer, and provides market size (US\$ million) and Year-over-Year (YoY) Growth, considering 2022 as the base year.
