Abstracts

Tumor Ablation is a general term for destroying cancer cells. Interventional ablation is a targeted, image-guided therapy for liver, kidney and lung cancers that uses the direct application of extreme heat (radiofrequency and microwave) or cold (cryoablation) to destroy tumor cells. It is most appropriate for small kidney and liver cancers that cannot be removed surgically. In fact, radiofrequency and cryoablation of small kidney cancers have been shown to be just as effective as major surgery.
