According to our (Global Info Research) latest study, the global Interventional Spine Devices market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Interventional spine procedures are used to treat painful spinal conditions. Interventional treatment options are often more efficient and effective than traditional therapy for spinal (back and neck) pain. The new techniques are excellent minimally invasive alternatives to conventional surgery. Lumbar disc disease, sacroiliac joint, and degenerative lumbar facet joints pain account for nearly 70% of the cases of lower back pain.

Osteoporosis is a common disease characterized by low back pain and deterioration of bone tissue, which makes the bone fragile and susceptible to fracture. Osteoporosis is also the primary cause for vertebral compression fractures (VCFs) in senior citizens. Vertebral collapse is caused by many complications, particularly osteoporosis, metastatic disease, and hemangiomas. VCFs cause impaired mobility, severe acute and chronic pain, and reduced quality of life.
