Interventional Ventricular Assist Devices are minimally invasive cardiac assist devices designed to provide temporary circulatory support during cardiac surgery or the treatment of acute heart failure. These systems, implanted through sophisticated interventional procedures, are capable of assisting pumping blood in or around the heart to maintain blood circulation, buying patients time to recover or serving as a bridge to long-term treatment. The operation of IVADs relies on an external power supply and control unit, which can be rapidly deployed to provide immediate hemodynamic support to the patient.
