Abstracts

Intramuscular injector is an injecting device used to delivering medications deep into the muscles. At present, intramuscular injectors are used in modern medicine to enable quick absorption of medication in the bloodstream. Generally, these injectors are used to deliver vaccines and drugs. In addition, these are highly preferred to other drug delivery routes for quick treatment, as muscle tissues have higher blood supply as compared to the tissues present under the skin and muscles are capable of holding high volume of medication.

According to our (Global Info Research) latest study, the global Intramuscular Injector market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

The global intramuscular injectors market is driven by growth in prevalence of chronic diseases that require medications through muscles, rise in demand for biosimilars and vaccination, and increased demand for drug delivery due to its advantages.
