Abstracts

Intranet penetration software is a tool used to expose services within the local area network to the public Internet. Through the intranet penetration software, users can access servers, applications or devices in the internal network from the outside, realizing communication and data exchange between the intranet and the external network. This software typically forwards external requests to the internal network by establishing a secure connection channel, and transmits responses from the internal network back to the external requester. Intranet penetration software can help users remotely manage equipment, access internal websites, share files and other functions, and facilitate users' data exchange and access control in different network environments.

According to our (Global Info Research) latest study, the global Intranet Penetration Software market size was valued at US\$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of %during review period.
