The intraocular lens is currently the most effective method for correcting the refraction of aphakic eyes. It replaces the original lens anatomically and optically, and constitutes a nearly normal system, especially the posterior chamber artificial lens fixed in the normal physiological position of the lens. lens. It can be used for one eye, and the visual acuity can be restored quickly after operation, and it is easy to establish binocular monovision and stereopsis. The intraocular lens implantation system consists of a folder and a pusher. The folding clip is made of polypropylene, and the injector is composed of a syringe and a push rod. It does not directly contact the human body. It is a component used for loading and assisting the use of the folding clip; The components used to assist the intraocular lens injection are made of silicone rubber.
