Abstracts

The global Intraoperative Ultrasound market size is expected to reach \$ 1372 million by 2032, rising at a market growth of 3.2% CAGR during the forecast period (2026-2032).

Intraoperative Ultrasound refers to medical imaging systems used during surgical procedures to provide real-time ultrasound guidance for lesion localization, margin assessment, blood flow evaluation, and surgical pathway planning. Unlike preoperative imaging, intraoperative ultrasound dynamically reflects tissue changes during surgery, playing a critical role in neurosurgery, hepatobiliary surgery, breast surgery, and minimally invasive interventions. The system typically consists of a main imaging platform, specialized intraoperative probes, image processing modules, and sterile accessories, emphasizing image clarity, real-time responsiveness, and operational convenience. With the advancement of precision and minimally invasive surgery, intraoperative ultrasound has become an essential tool to enhance resection accuracy and reduce complication risks, particularly in complex tumor and function-preserving procedures. In 2025, global Intraoperative Ultrasound production reached approximately 35.67 k unit and price is about 30 K USD/Unit. The average gross profit margin of this product is 38%.

The widespread adoption of precision medicine and minimally invasive surgery is a key driver for the intraoperative ultrasound market. Complex tumor resections and function-preserving surgeries increasingly require real-time imaging support, positioning intraoperative ultrasound as an essential navigation complement. Compared with high-cost navigation systems, intraoperative ultrasound offers flexibility and broad applicability. Upgrades in healthcare infrastructure in emerging markets and growing demand for integrated imaging solutions further stimulate procurement expansion. Advances in artificial intelligence-based image enhancement and fusion technologies

continue to enhance system value.

Intraoperative ultrasound relies heavily on operator expertise, and the learning curve may slow adoption. High-end probes and sterile consumables increase overall costs, creating budget constraints for some hospitals. In large tertiary hospitals, intraoperative MRI or advanced navigation systems may present competitive alternatives. Stricter regulatory requirements and centralized procurement policies can also exert pressure on profit margins.

Downstream demand is becoming increasingly specialized and integrated. Neurosurgery and hepatobiliary surgery represent core application areas, with rising demand for high-resolution and multimodal imaging. Hospitals focus on system compatibility with existing imaging platforms and data integration capabilities. Mobile and modular designs are favored to allow multi-operating room sharing. Integrated solutions combining intraoperative feedback with postoperative data analysis are shaping future development directions.

Upstream components primarily include piezoelectric crystal materials, electronic components, and precision probe assemblies. High-performance piezoelectric materials directly influence imaging quality and signal stability. Core electronic chips determine computational capacity and image processing efficiency. Probe encapsulation and sterile housing materials must meet biocompatibility and sterilization standards. The technological maturity and stability of the upstream supply chain significantly impact overall system performance and cost structure.
