Intravenous general anesthesia refers to a method in which one or several drugs are injected intravenously and act on the central nervous system through blood circulation to produce general anesthesia. According to different administration methods, intravenous anesthesia can be divided into single administration method, divided administration method and continuous administration method. Due to some limitations of its own, the use of intravenous general anesthesia was once limited. However, since the 1980s, with the continuous improvement of clinical pharmacology research methods, the development of new strong and short-acting intravenous anesthetics and the advent of computerized intravenous automatic drug delivery systems, intravenous anesthesia has been greatly improved. And development, has now become the mainstream general anesthesia solution.
