Abstracts

Iron is an essential element as it plays an important role in many vital biological processes such as the synthesis of heme which forms the basis of hemoglobin (Hb) the oxygen-carrying protein of the blood, the formation of myoglobin, energy metabolism, neurotransmitter production, the formation of collagen and immune system function. Lack of iron is one of the principal causes of anemia in the general population. It is not surprising that iron deficiency anemia (IDA) is associated with increased morbidity and mortality.
