Abstracts

Intravenous access device can be implanted under the skin which allows the medication to be delivered directly into large veins. Large veins clot less likely and so intravenous access devices can be left inside for long periods. Intravenous access devices are small, flexible tubes placed in large veins for people who require frequent access to the bloodstream. These devices are often also referred as venous access ports or catheters as they allow access to the veins without the use of deep needle stick. Placement of intravenous access devices is usually in one of the large veins of the chest or neck where they can remain in place for long periods such as weeks, months or even longer.
