Abstracts

The global Intravesical Bacillus Calmette market size is expected to reach \$ 614 million by 2032, rising at a market growth of 8.0% CAGR during the forecast period (2026-2032).

Intravesical Bacillus Calmette is used to treat a certain type of bladder cancer. Bladder cancer is the growth of abnormal or cancerous cells on the inner lining of the bladder wall. BCG helps prevent the cancer from coming back in the bladder lining, and also reduces the risk of it becoming invasive.

The intravesical Bacillus Calmette-Gu?rin (BCG) market is driven by the increasing incidence of bladder cancer globally, particularly non-muscle invasive bladder cancer (NMIBC), for which BCG is a standard and effective treatment. As the aging population grows, the prevalence of bladder cancer rises, fueling demand for BCG therapy. Additionally, ongoing research into optimizing BCG regimens and improving patient outcomes through combination therapies has further contributed to the market's expansion. The therapy's proven efficacy in preventing recurrence and progression of bladder cancer remains a strong driver for its continued use.

One of the major challenges in the intravesical BCG market is the frequent shortages of BCG supply, which can disrupt treatment schedules and negatively impact patient care. These shortages are often due to the complex manufacturing process and limited production facilities. Additionally, BCG treatment is associated with side effects, such as bladder irritation and infection risk, which can deter some patients from completing their treatment course. Moreover, newer immunotherapies and alternative treatments for bladder cancer are emerging, which could create competition for BCG in the long term.

The major players in the industry are Merck, Japan BCG Laboratory, China National Biotec, Serum Institute of India and GSBPL, with a total market share of 70%.
