The global Iodinated Contrast Media in Interventional X-Ray market size is expected to reach \$ 2718 million by 2032, rising at a market growth of 5.6% CAGR during the forecast period (2026-2032).

In 2025, global Iodinated Contrast Media in Interventional X-Ray production reached approximately 4,000 K Litres, with an average global market price of around 450 US\$/L.

Iodinated Contrast Media in Interventional X-Ray refers to organic iodine-containing compounds specifically used in interventional X-ray procedures, which enhance the visibility of internal blood vessels, tissues and lesions by absorbing X-rays, helping doctors clearly observe the anatomical structure and pathological state of target areas, guide interventional operations accurately, and evaluate the effect of interventional treatment, with good biocompatibility and rapid excretion characteristics to ensure the safety of clinical applications.

The demand for Iodinated Contrast Media in Interventional X-Ray is driven by the increasing prevalence of chronic diseases, the growing popularity of interventional X-ray technologies in clinical practice, and the continuous improvement of medical infrastructure, especially the rising application demand in cardiovascular and oncology interventional treatments; business opportunities lie in the R&D and promotion of low-osmolar, low-nephrotoxic and environment-friendly products, the acceleration of domestic substitution to break the monopoly of international manufacturers, and the expansion of market demand in emerging regions with the popularization of interventional medical services.
