## Abstracts

One way in which sterilization by way of irradiation may occur is when ionizing radiation is used. In the context of sterilization, ionizing radiation is a type of short wavelength, high intensity radiation that is used to destroy all microorganisms during sterilization. The forms of ionizing radiation used for sterilization are known as gamma irradiation, electron irradiation and x-ray irradiation.

Scope of the Report:

This report studies the Ionizing Radiation Sterilization market status and outlook of Global and major regions, from angles of players, countries, product types and end industries; this report analyzes the top players in global market, and splits the Ionizing Radiation Sterilization market by product type and applications/end industries.

The food industry has recently renewed its interest in the use of radiation for food preservation. It can be used to prevent spoilage in seafood by doses of 100 to 250 kilorads, in meats and poultry by doses of 50 to 100 kilorads, and in fruits by doses of 200 to 300 kilorads. In Europe, milk and other foods are often irradiated to achieve sterility. Especially high energy electron beams, is used for the sterilization of pharmaceuticals and disposable dental and medical supplies, such as plastic syringes, surgical gloves, suturing materials, and catheters.

The global Ionizing Radiation Sterilization market is valued at xx million USD in 2017 and is expected to reach xx million USD by the end of 2023, growing at a CAGR of xx% between 2017 and 2023.
