## Abstracts

According to our (Global Info Research) latest study, the global Ionomer market size was valued at US\$ 845 million in 2025 and is forecast to a readjusted size of US\$ 1078 million by 2032 with a CAGR of 3.6% during review period.

An ionomer is a polymer that comprises repeat units of both electrically neutral repeating units and a fraction of ionized units (usually no more than 15 mole percent) covalently bonded to the polymer backbone as pendant group moieties. This means that most ionomers are copolymers of the neutral segments and the ionized units, which usually consist of carboxylic acid groups. The classification of a polymer as an ionomer depends on the level of substitution of ionic groups as well as how the ionic groups are incorporated into the polymer structure. Ionomers have unique physical properties including electrical conductivity and viscosity—increase in ionomer solution viscosity with increasing temperatures. Ionomers also have unique morphological properties as the non-polar polymer backbone is energetically incompatible with the polar ionic groups. As a result, the ionic groups will microphase separate into ionic-rich domains in most ionomers.

Global key players of ionomer include Dow, Kuraray, DuPont, etc. The top three players hold a share about 52%. North America is the largest producer, has a share about 71%, followed by Europe and Japan, with share 19% and 8%, respectively. The largest market is North America, with a share about 36%, followed by Europe and Asia-Pacific, with share 30% and 27%, separately.
