## Abstracts

According to our (Global Info Research) latest study, the global IoT-based Drainage Decision Support System market size was valued at US\$ 1633 million in 2025 and is forecast to a readjusted size of US\$ 3017 million by 2032 with a CAGR of 9.3% during review period.

An IoT-based drainage decision-making system is an intelligent system designed to monitor the operational status of drainage infrastructure, issue early warnings, and facilitate dispatch decisions. It achieves this by deploying various sensors and monitoring devices across urban drainage networks, pumping stations, rain gauges, and critical nodes to collect real-time data—such as water levels, flow rates, and rainfall amounts—and subsequently transmitting this data to a central platform for analysis and processing via IoT communication technologies. Typically, the system integrates data analysis models or algorithms to dynamically assess the risks of urban flooding, the load on the drainage network, and drainage efficiency, thereby providing dispatch personnel with scientific support for decision-making. It is widely applied in the fields of urban flood control, drainage management, and smart water management.
