Abstracts

The global IP Repeaters market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Repeaters are used to enhance the transmission range and reliability of radio signals. The repeaters usually consists of a pair of transceivers, which are located in different positions and connected by cables or radio signals. When a radio equipment (such as hand-held radio or vehicle-mounted radio) transmits a signal, the repeaters will receive and amplify the signal, and then retransmit the signal to expand the signal coverage. The repeaters can be used for various purposes, such as extending the radio communication range, enhancing the communication quality, or connecting different communication systems to achieve interoperability. An IP repeater is a repeater that uses a Radio Over Internet Protocol (RoIP) to transmit voice signals carried by radio signals of a conventional repeater through an IP address network.

This report studies the global IP Repeaters production, demand, key manufacturers, and key regions.
