According to our (Global Info Research) latest study, the global Iparomlimab market size was valued at US\$ 64.82 million in 2025 and is forecast to a readjusted size of US\$ 316 million by 2032 with a CAGR of 15.7% during review period.

Iparomlimab is a humanized monoclonal antibody designed to selectively target the programmed cell death protein 1 (PD-1) pathway, functioning as an immune checkpoint inhibitor to restore and enhance anti-tumor immune responses. By specifically binding to PD-1 receptors expressed on T lymphocytes, it blocks inhibitory signaling interactions with PD-L1 and PD-L2, thereby relieving immune suppression, promoting T-cell activation, proliferation, and cytotoxic activity against malignant cells. Engineered with an optimized IgG4 backbone to minimize off-target effector functions and improve stability, it demonstrates favorable pharmacokinetic and safety profiles for clinical application. As a targeted immunotherapeutic agent, Iparomlimab is under clinical development for multiple solid tumors and hematological malignancies, often investigated in combination with other immunomodulatory antibodies to achieve synergistic anti-cancer efficacy. In 2025, global Iparomlimab production reached approximately 120,000 vials.

Iparomlimab, a PD-1 immune checkpoint inhibitor independently developed by Qilu Pharmaceutical, is built upon the proprietary MabPair® technology platform and enters the highly competitive tumor immunotherapy market with differentiated molecular design and clinical safety advantages. Its core market value is embodied in the world's first-in-class combination antibody therapy with tivozalimab, which delivers synergistic anti-tumor efficacy by simultaneously blocking the PD-1 and CTLA-4 pathways, demonstrating significant clinical benefits and application potential in indications such as recurrent or metastatic cervical cancer. Amid intensifying competition in the PD-1/PD-L1

inhibitor market, iparomlimab differentiates itself from conventional single-agent PD-1 products through the unique mechanism of combination therapy, treatment convenience independent of PD-L1 testing, and improved accessibility driven by insurance coverage. Future market expansion will rely on the advancement of multi-tumor clinical pipelines, penetration into primary healthcare markets, and international layout to build differentiated competitiveness in precision immunotherapy and combination treatment regimens. Concurrently, it faces multiple challenges including intense competition from a surge of domestic similar products, market penetration by international pharmaceutical giants, and rapid evolution of treatment paradigms. Its commercial performance and market share will be highly dependent on the speed of indication expansion, strength of clinical evidence, and coverage of commercialization channels.
