iris and face multimodal biometric device is an advanced identity verification system that integrates iris recognition and face recognition technologies. The device captures the user's iris and face images through a high-definition camera, and uses advanced image processing algorithms and pattern recognition technology to accurately match and verify the user's biometric features. Iris recognition technology is considered to be one of the safest biometric methods due to its high uniqueness, stability and anti-counterfeiting properties; while face recognition technology also has broad prospects in practical applications due to its non-contact and easy acceptance characteristics. The iris and face multimodal biometric device combines the advantages of the two technologies to further improve the accuracy and security of identity verification. The device is widely used in finance, security, access control, social security and other fields, providing users with more comprehensive and reliable biometric solutions.
