Abstracts

The global Iron-Molybdenum Catalyst market size is expected to reach $ 87.48 million by 2032, rising at a market growth of 4.0% CAGR during the forecast period (2026-2032).

Iron-molybdenum catalysts are industrial catalytic materials formed using iron oxides and molybdenum oxides as the main active components, through the application of supports, additives, and specific preparation processes. They possess excellent redox properties, selectivity, and thermal stability, and are primarily used in chemical reactions such as the selective oxidation of methanol to formaldehyde. They can also be applied to partial oxidation, dehydrogenation, and environmental catalytic processes.

Upstream applications mainly include molybdenum oxide, molybdates, iron oxides, iron salts, support materials, additives, and industrial chemicals. Downstream applications are primarily in the production of formaldehyde, resins, adhesives, engineered wood products, fine chemicals, and related chemicals, extending to environmental protection and other catalytic reaction fields.

The global average price of iron-molybdenum catalysts is approximately US$34,000/ton, with sales volume of approximately 1,850–1,950 tons and an industry gross margin of 18%.

The future global iron-molybdenum catalyst market will develop towards higher activity, higher selectivity, longer lifespan, and lower energy consumption. With the continuous upgrading of formaldehyde and its downstream resin, wood processing, building materials, and fine chemical industries, manufacturers will pay more attention to the methanol conversion efficiency, formaldehyde selectivity, thermal stability, and

operating cycle of catalysts. Meanwhile, increasingly stringent environmental regulations will accelerate the application of catalysts with low by-products, low emissions, and high resource utilization. In the future, catalyst manufacturers will further improve stability under complex operating conditions by optimizing the iron-molybdenum ratio, support structure, molding process, and surface activity control, and strengthen the recovery and recycling of molybdenum resources from spent catalysts to enhance the economic efficiency of the entire product lifecycle.
