Abstracts

According to our (Global Info Research) latest study, the global Irreversible Electroporation Ablation Device market size was valued at US\$ 143 million in 2025 and is forecast to a readjusted size of US\$ 211 million by 2032 with a CAGR of 5.6% during review period.

An irreversible electroporation ablation device is an advanced medical system that performs non-thermal ablation of tumor tissue by applying high-voltage pulsed electric fields. By placing multi-channel electrodes around the target lesion and delivering short, high-intensity electrical pulses, the device induces permanent nanopores in cell membranes, leading to apoptosis and selective tissue destruction while preserving surrounding critical structures such as blood vessels, bile ducts, and nerves. The system typically consists of a high-voltage pulse generator, electrode probes, control and monitoring modules, image-navigation interfaces, and data-processing software. Key upstream inputs include high-voltage electronic modules, medical-grade titanium alloy or stainless-steel electrodes, insulating coatings, and precision mechanical components. Downstream customers primarily include general hospitals, cancer centers, cardiac centers, interventional departments, and research institutions, with applications spanning tumor ablation, tissue modulation, and experimental bioelectrical therapies. In 2025, global nameplate capacity is estimated at approximately 1,050 units, with actual sales of about 878 units, an average selling price of around USD 165,000 per unit, and industry gross margins typically ranging from 25% to 40%. Supported by growing demand for minimally invasive therapies and advances in precision imaging integration, the market is expected to maintain steady expansion.
