According to our (Global Info Research) latest study, the global Islet Isolator market size was valued at US\$ 180 million in 2024 and is forecast to a readjusted size of USD 231 million by 2031 with a CAGR of 3.7% during review period.

Islet isolation is a medical device specially used to separate islet cells from pancreatic tissue. Islet isolation is the process of separating endocrine islets from exocrine pancreatic tissue by mechanical methods or collagenase digestion. Islet isolation is an important tool to achieve this process. Islet isolation assists in the separation of islets by automating and monitoring the pancreatic digestion process. It is usually equipped with advanced software and various sensors to accurately control the oscillation, temperature and flow rate of the chamber system, thereby ensuring the controllability and safety of the islet isolation process.
