According to our (Global Info Research) latest study, the global Islet Transporter market size was valued at US\$ 84.5 million in 2024 and is forecast to a readjusted size of USD 135 million by 2031 with a CAGR of 6.9% during review period.

The islet transporter is a device specially used for transporting islet cells by air. The main function of the islet transporter is to simulate the environment of the incubator to ensure that the gas concentration around the islet cells remains constant throughout the flight. This is essential for maintaining the activity and function of islet cells, because islet cells are important cells responsible for secreting hormones such as insulin and glucagon, and play a key role in maintaining blood sugar balance. The islet transporter can not only be used independently, but also can be linked with other diabetes management devices such as insulin auto-injectors, insulin pumps, and rapid blood glucose meters. For example, when used in conjunction with an insulin auto-injector, the islet transporter can monitor blood sugar levels in real time and trigger the release of insulin when blood sugar rises. This linkage makes the islet transporter an important tool in diabetes management, providing patients with a more comprehensive and personalized treatment plan.
