Abstracts

The global Iso-tridecanol Polyoxyethylene Ether market size is expected to reach $ 534 million by 2032, rising at a market growth of 4.4% CAGR during the forecast period (2026-2032).

Iso-tridecanol Polyoxyethylene Ether is a class of non-ionic surfactants produced by the addition of ethylene oxide to branched C13 isotridecyl alcohol (which serves as the hydrophobic group). Rather than a single compound, the product exists as a series with varying degrees of ethylene oxide (EO) addition; it is characterized by rapid wetting, excellent emulsification and detergency, relatively low foaming, and strong resistance to acids and alkalis.

The primary upstream raw materials are isotridecyl alcohol and ethylene oxide. Isotridecyl alcohol is a highly branched C13 oxo-alcohol typically obtained by processing C4 olefins into branched olefins, followed by oxo-synthesis and hydro-refining; ethylene oxide is primarily derived from the oxidation of ethylene. In the midstream stage, raw materials undergo dehydration, EO addition, aging, neutralization, degassing, and filtration to produce variants with specific EO addition numbers, HLB values, cloud points, and active ingredient contents. Downstream enterprises utilize these products in sectors such as personal care, agriculture, textiles, and chemicals, leveraging their wetting, emulsifying, dispersing, low-foaming, and water-soluble properties.

Global sales volume in 2025 is projected to be approximately 160,000 metric tons, with a comprehensive average price of around US$2,400 per ton and gross profit margins for major manufacturers ranging from 23% to 30%.

Key drivers for the isotridecyl alcohol polyoxyethylene ether industry include the shift toward APEO-free formulations, the demand for low-foaming, high-efficiency industrial cleaners, and the growing need for rapid wetting and stable emulsification in sectors such as textiles, coatings, and pesticide formulations. Competitive differentiation centers on EO addition control, foaming characteristics, wetting speed, batch-to-batch consistency, and formulation compatibility. Industry growth remains constrained by price fluctuations of isotridecyl alcohol and ethylene oxide, stringent regulations governing hazardous chemical production, and competition from alternative fatty alcohol polyoxyethylene ethers. The market is expected to maintain steady growth, with high-active-content, low-foaming, narrow-distribution, and customized grades emerging as key areas of development.
